George Mason  
University

---

Dr. Kevin Moran

# Google Firebase Tech Talk

firebase

# What is Firebase?

- Original Feature was Real-time database
- Store & sync JSON format data between clients
- Native clients for Javascript, iOS, Android
- Can build client apps with realtime multi-user interactions with no backend

# What is Firebase?

- Since the Firebase was acquired by Google, it has evolved, and has more features:
  - Authentication
  - Hosting
  - Cloud Storage
  - Machine Learning Framework
  - Crashlytics
  - Performance Monitoring
  - etc...

# Demo of Firebase Console

# Class Sign Up App

Spark plan

## Get started by adding Firestore to your app

Add an app to get started

### Store and sync app data in milliseconds

Project Overview

### Develop

- Authentication
- Cloud Firestore
- Realtime Database
- Storage
- Hosting
- Functions
- Machine Learning

### Quality

Crashlytics, Performance, Test Lab,...

### Analytics

Dashboard, Events, Conversions, A...

### Grow

Predictions, A/B Testing, Cloud Me...

Extensions

Spark  
Free \$0/month

# Basic HTML/JS Example

- Create index.html and index.js files

```
<html>
  <head>
    <script src = "https://cdn.firebase.com/js/client/2.4.2/firebase.js"></script>
    <script type = "text/javascript" src = "index.js"></script>
  </head>

  <body>

  </body>
</html>
```

# Setting up the Database

- Add entries for your test app
- Represents JSON object(s)

# Write Data

- We use the `set()` method

```
var groupsRef = firebase.database().ref("groups/");

groupssRef.set ({
  Group1: {
    tech: "vue.js",
  },

  Group2: {
    tech: "electron",
  }
});
```

# Read Data

- We use the `on()` method

```
var ref = firebase.database().ref();

ref.on("value", function(snapshot) {
  console.log(snapshot.val());
}, function (error) {
  console.log("Error: " + error.code);
});
```

# JSON Representation

```
{  
  "Groups" : {  
    "Group1" : {  
      "tech" : "vue.js"  
    },  
    "Group2" : {  
      "tech" : "electron"  
    }  
  }  
}
```

# Saving Data

- `set()` - sets a location
- `update()` - updates some keys without replacing all data
- `push()` - add a list of data to a reference, generating a `uniqueID`

# Retrieving Data

- Subscribe to a reference location. Any changes generate an event.
- `value`, `child_added`, `child_changed`, `child_removed`

# Work Queues

- Supports transactions - can atomically dequeue item for processing
- Enables sharing processing tasks across pool of clients

# Technology Status

- Commercial startup from 2011
- >200K users
- Free tier for small scale use, paid tiers for commercial-scale use
- Acquired by Google in Oct 2014
- Now used to build apps at Google

# Competitors/Alternatives

- Traditional JSP, .NET, PHP, ... backend
- PubNub - provides realtime data streams
- [realtime.co](http://realtime.co) - realtime messaging infrastructure
- [socket.io](http://socket.io) - can build directly on top of WebSockets

# Summary

- Enables pushing processing from backend to clients
- Enables social, collaborative apps to be built without a backend
- Best suited for shared global data where clients are using same version of data
- Not suitable for processing tasks where clients are untrusted or for complex queries on data
