

SWE 632 - Design & Development of User Interfaces

Spring 2021

George Mason
University

Dr. Kevin Moran

Week 2:

Sketching &
Prototyping

Administrivia

- Project Checkpoint 0, due today
- Tech Talk Signups, due today
- Project Checkpoint 1 out now, due Next Week
- Project Checkpoint 2, due in three weeks, (Initial implementation of your app)

Project Checkpoint I

Description

In this Project Checkpoint, you will first create at least 3 sketches that will serve as a storyboard for your proposed web app. These sketches should be done on paper, and then photos or scans of the sketches can be uploaded with the assignment. In addition to the sketches, you will also create 2 wireframes of the two most "important" screens of your app.

1. When working on the storyboards, think primarily about how different parts of your application will fit together based on the tasks that users will perform.
 - If you are working in a group, we *strongly* suggest that at least two team members work on the storyboard sketching, and then the entire team meets and critiques the design.
2. When creating the wireframes, feel free to use any software that you prefer, and work collaboratively if you are in a group.
3. Remember keep your wireframe simple, and "deliberately unfinished" - do not include graphics, colors, or fonts.
4. After you have created the storyboard (and critiqued it with your teammates if applicable), write a brief 1-2 paragraph explanation of the user flow through each frame.
5. For each of your 2 wireframes, write a 1 paragraph rationale regarding the design choices made. (Consider the "Creating a Wireframe" questions from the Week 2 Lecture in your rationale!)
6. Please include the scans of the storyboard, and images of the mockup, and your explanations/rationales in a single PDF document.

Submission Instructions

Submit your assignment through Blackboard as a single PDF file. If you are working in a group, only one person per group should submit on behalf of your group. You should create a separate document for each of the 3 web apps you are reviewing.

If you are working in a group, each group member must separately submit a Statement of Contributions document with your name, list of group members, and a one or two paragraph statement describing how each of the group members contributed to this Project Checkpoint.

Office Hours

- Xu Han: Wed 10am-12pm
- Dr. Moran: After class (7:10 - 7:45) & Tuesdays (4:00pm-5:00pm)

Class Overview

- Part 1 - Sketching & Storyboards: Working through & linking ideas
- Part 2 - Wireframes & Design Critques: Contextualizing ideas to a UI
- Part 3 - Prototyping: Building (some) of the ideas
- Part 4 - In Class Activity: Sketching/Wireframing an Example
- 7 Minute Break
- Part 5: V2S Tech Talk: Dr. Moran

Sketching & Storyboards

How do You Brainstorm?

What is a Sketch?

“A conversation between the sketcher or designer and the artifact”

Why Sketch?

- Sketching offers visual medium for exploration, offering cognitive scaffolding to externalize cognition

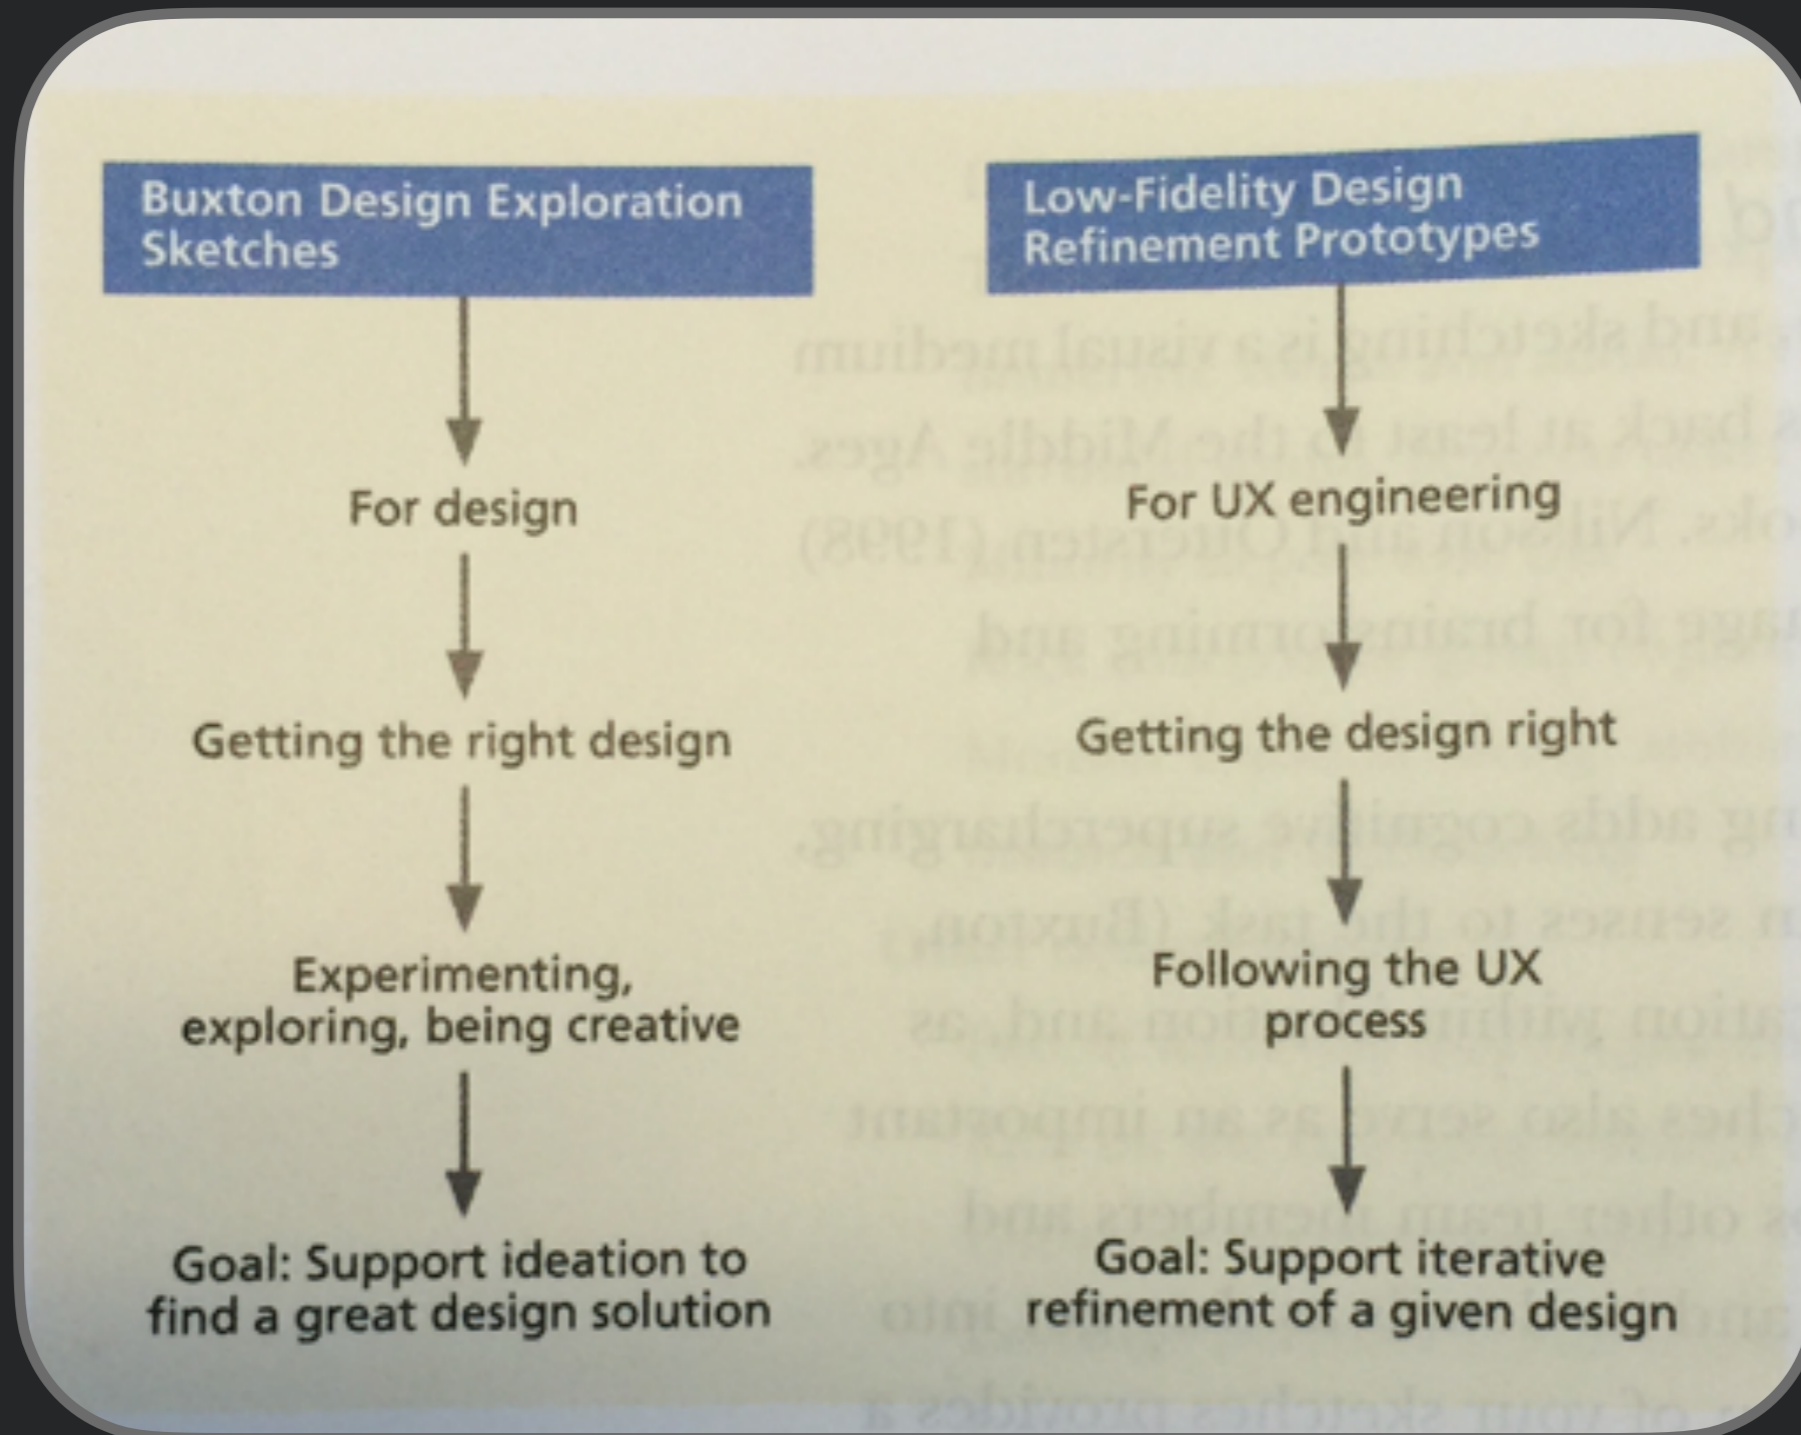

courtesy of www.leonardoda-vinci.org

Being Creative with Sketches

- How do you come up with a great idea?
 - Generate lots of ideas
 - Work through ideas through externalization in sketch
 - Critique the ideas
 - Refine them to make them better
- Sketching offers a low-cost medium for working with early ideas before committing to one
- Design is process of creation & exploration

Sketching vs. Prototyping

Physical Sketches

- Production tools for sketching:
 - whiteboards, blackboards, cork boards, flip chart easels
 - post it notes
 - duct tape, scotch tape, push pins, staples
 - marking pens, crayons, spray paint
 - scissors, hobby knives, foam core board
 - duct tape
 - bits of cloth, rubber

The Space Remembers

- Covering walls, whiteboards, etc. w/ materials is extremely useful
- Provides fast access for revisiting and remixing old ideas
- Facilitates group discussion of designs

Sketches are Sketchy

- Not mechanically correct and perfectly straight lines
- **Freehand**, open gestures
- Strokes may miss connections
- Resolution & detail **low** enough to suggest is concept
- Deliberately **ambiguous** & abstract, leaving “holes” for imagination

Rules for Sketching

- **Everyone** can sketch; you do not have to be artistic
- Most ideas conveyed more effectively with sketch than words.
- Sketches are **quick** and inexpensive to create; do not inhibit early exploration
- Sketches are **disposable**; no investment in sketch itself
- Sketches are **timely**; made in-the-moment, just-in-time
- Sketches are **plentiful**; entertain large # of ideas w/ multiple sketches of each

Sketches Include Annotations

- Annotations explain what is going on in each part of sketch & how

Revisiting the helium project

CURSOR AREA
FADDES IN

If the cursor moves
above the line or
"up" it (the cursor)
changes to helium.
If it moves down
it changes to air.
Speed is matched

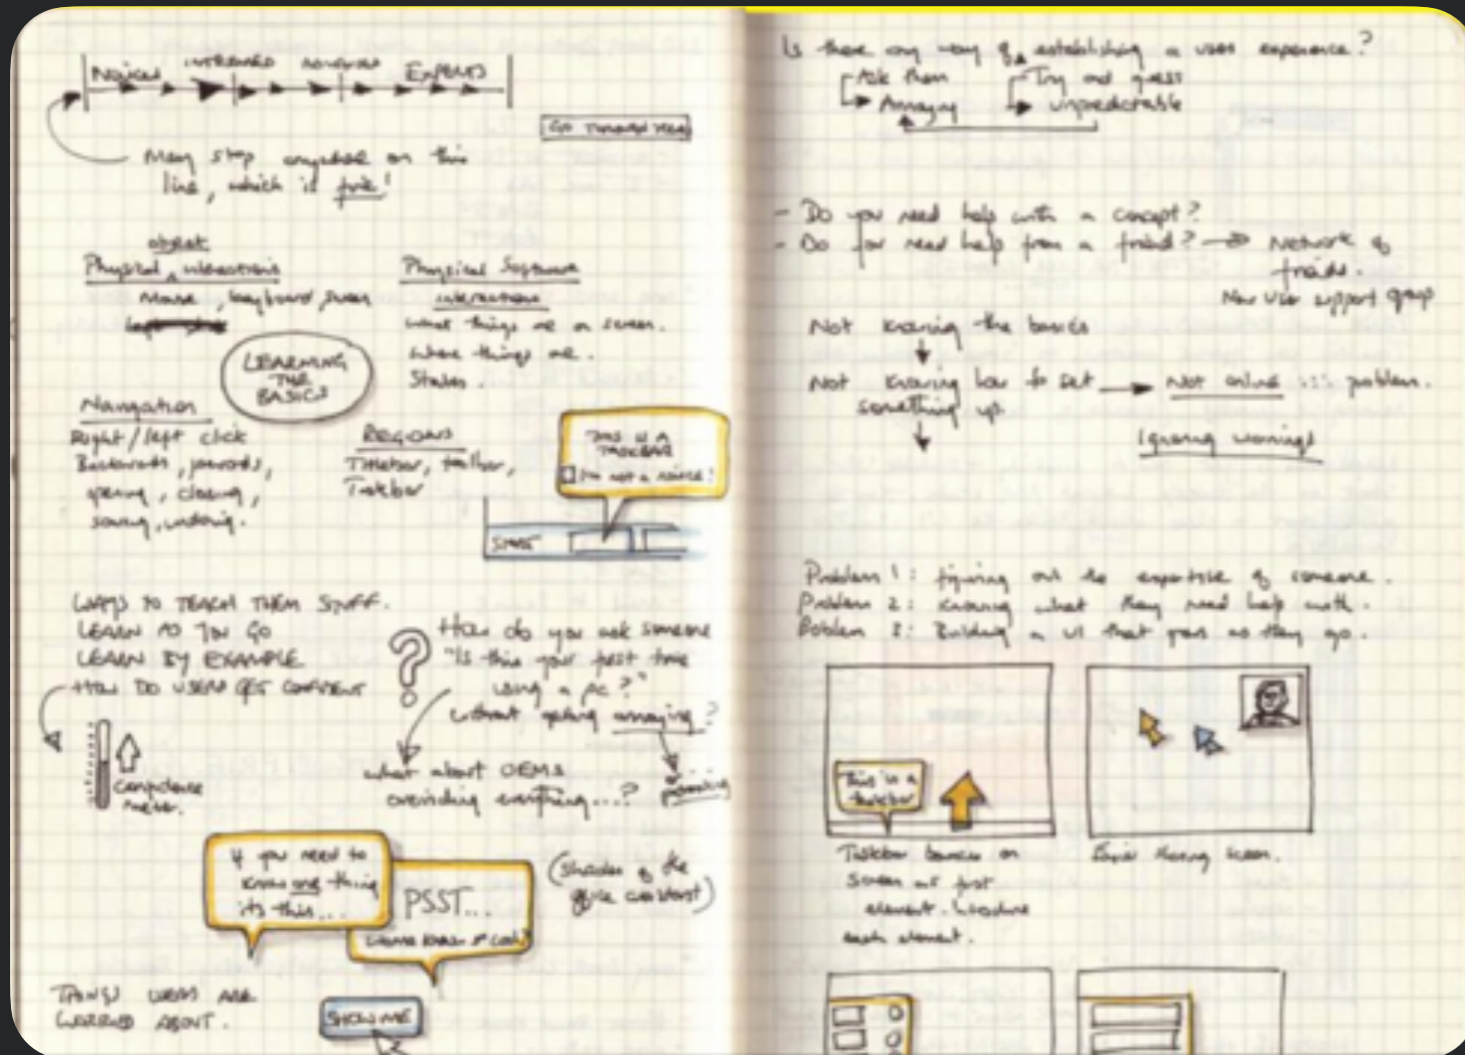

CAN THE
SPLIT BE
TOP AND
BOTTOM?

OR

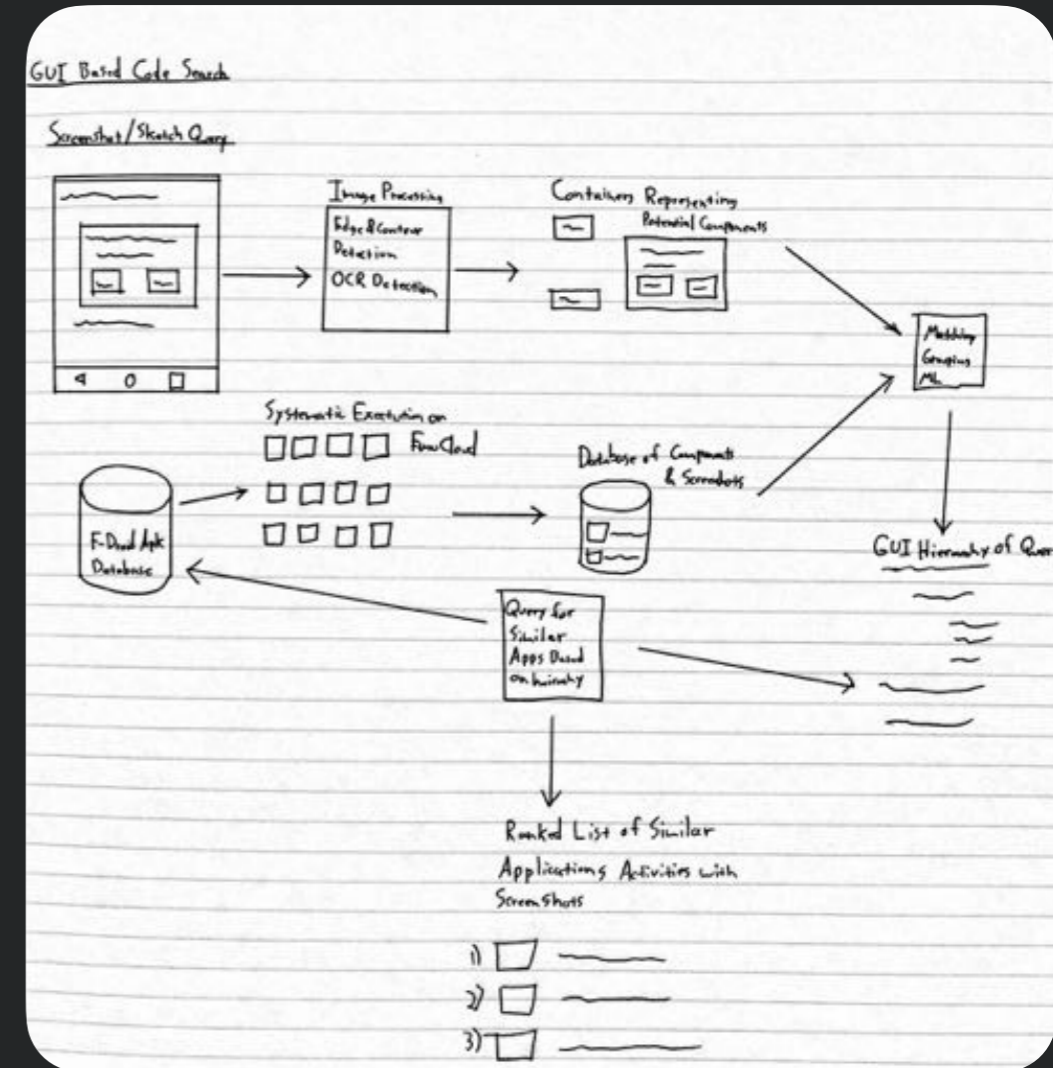

Single image used.
Black rectangle appears
when entering the
opposite area? Or
blurred cursor circle
just behaves differently
in one versus the other.

Fidelity of Sketches & Mockups

Storyboard ————— Wireframe ————— Prototype

low

(many details left unspecified)

Fidelity

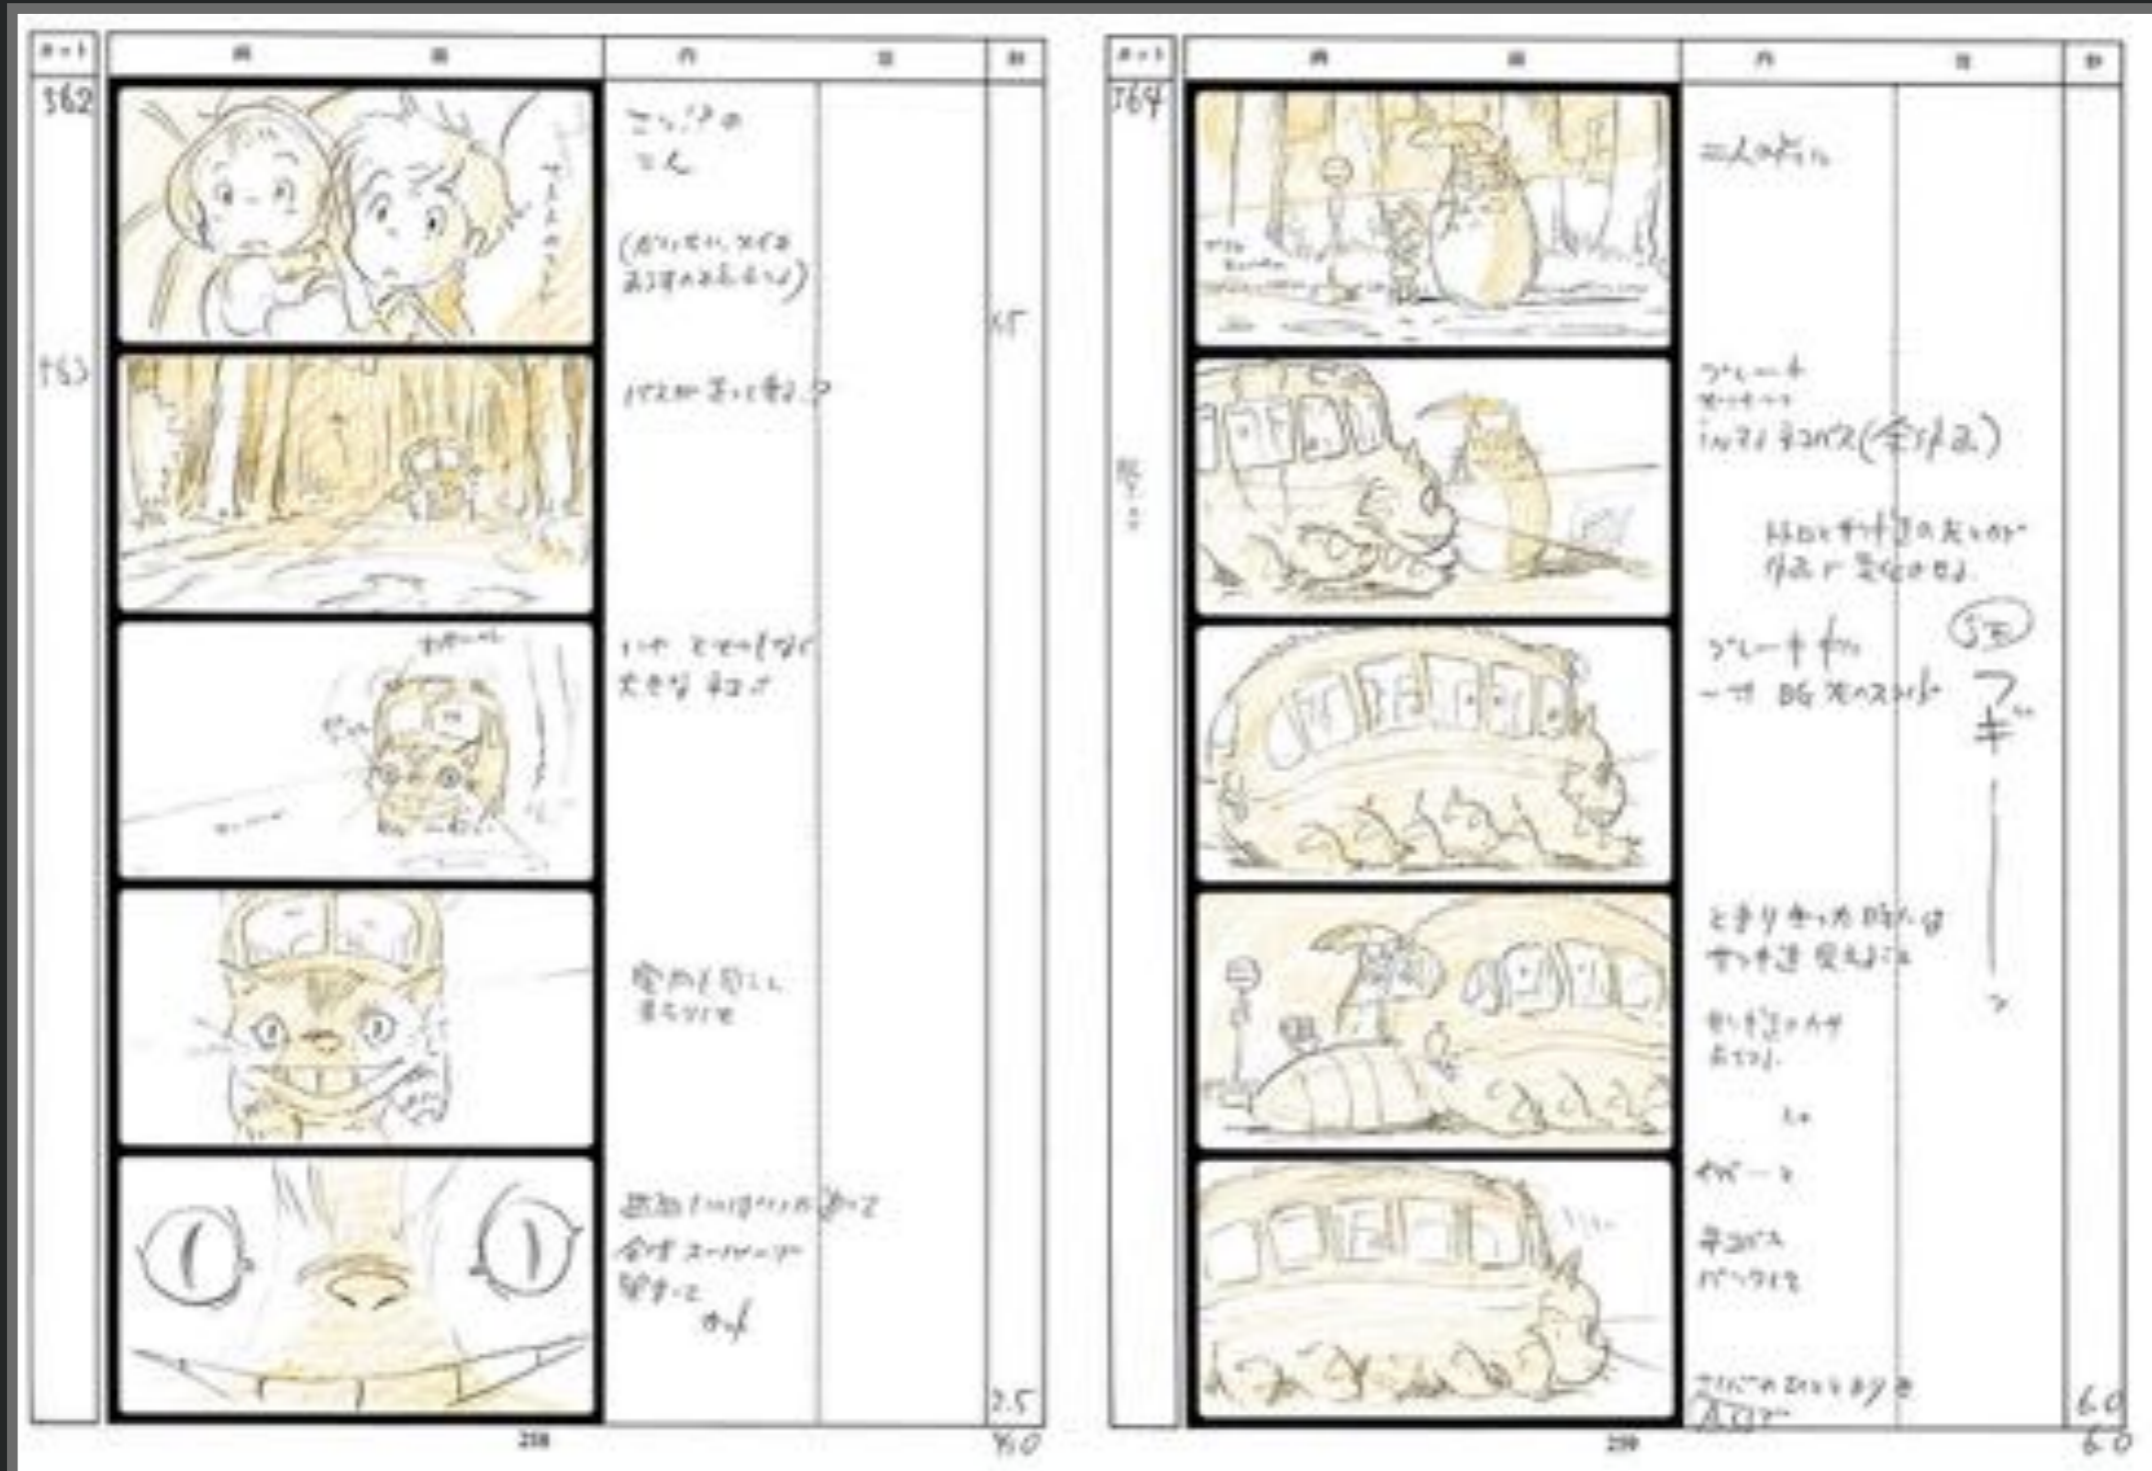

high

(more polished & detailed)

Storyboards

Classic StoryBoards

Storyboard from Studio Ghibli: "My Neighbor Totoro"

Classic Storyboards

Credit Studio Ghibli: *"Spirited Away"*

Classic Storyboards

Credit Studio Ghibli: *"Spirited Away"*

Storyboards for UI Design

- Sequence of visual “frames” illustrating *interplay* between user & envisioned system
- Explains how app fits into a larger *context* through a single scenario / story
- Bring design to *life* in graphical clips - freeze frame sketches of user interactions
- “Comic-book” style *illustration* of a scenario, with actors, screens, interaction, & dialog

Crafting a Storyboard

- Set the stage:
 - Who? What Where? Why? When?
- Show key interactions with application
- Show consequences of taking actions
- May also think about errors

Example Elements of a UI Storyboard

- Hand-sketched pictures annotated with a few words
- Sketch of user activity before or after interacting w/ system
- Sketches of devices & screens
- Connections with system (e.g., database connection)
- Physical user actions
- Cognitive user action in “thought balloons”

Example: Ticket Kiosk

Ticket buyer walks up to the kiosk

Sensor detects user & starts immersive process

Displays “Occupied” sign on wraparound case

Detects people with ID card

Example: Ticket Kiosk

Greets buyer and asks for PIN

Shows recommendations & most popular categories

Buyer selects “Boston symphony at Burruss Hall”

Plays music from symphony, shows date & time picker

Frame Transitions

- Transitions between frames particularly important
- What users think, how users choose actions
- Many problems can occur here (e.g., gulfs of execution & evaluation) - we will talk more in a future class!
- Useful to think about how these work, can add thought bubbles to describe

Wireframes & Design Critiques

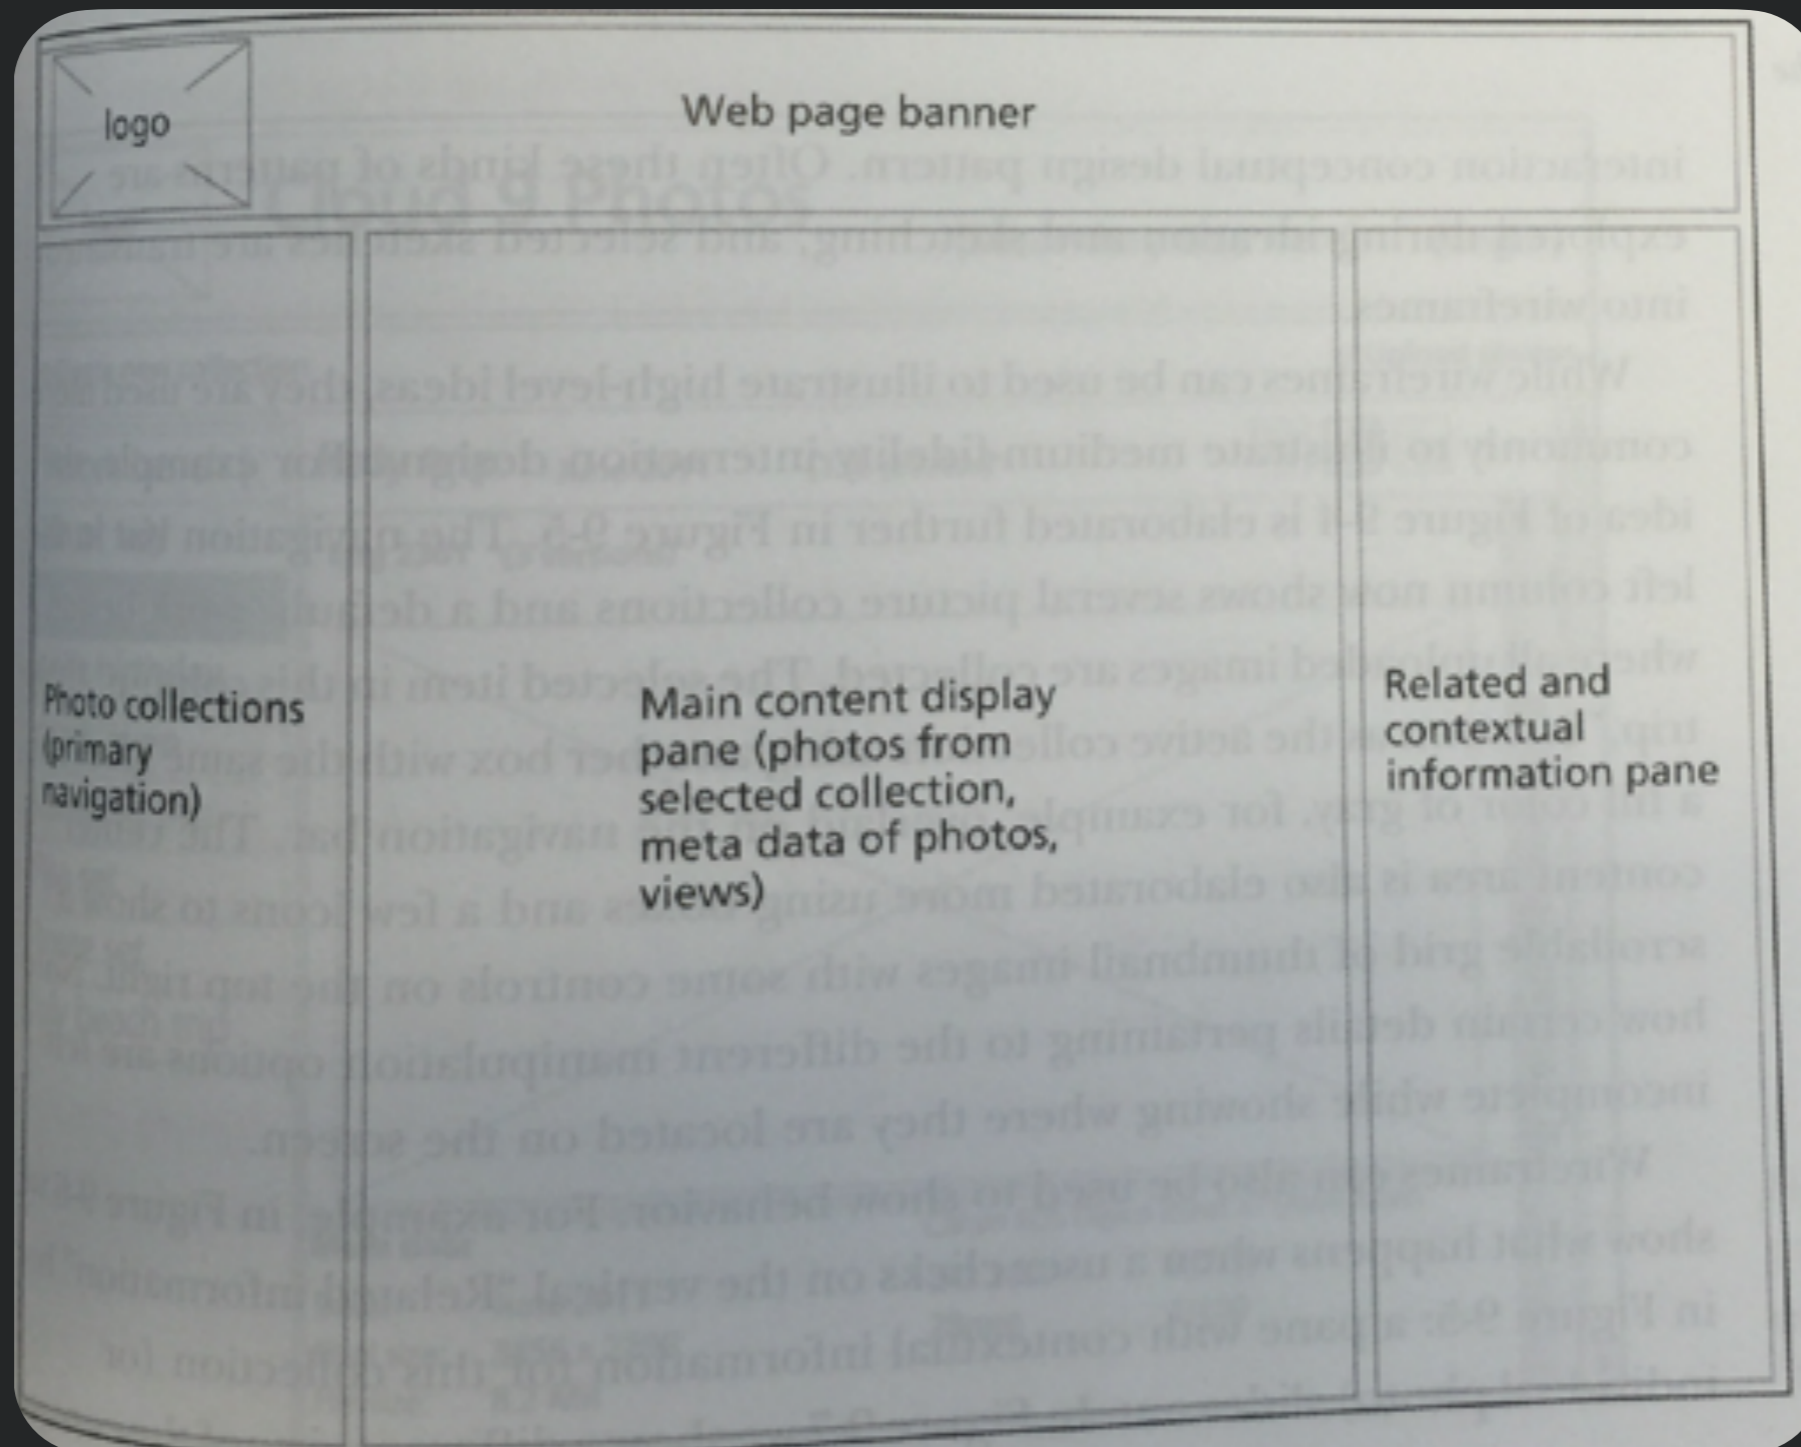

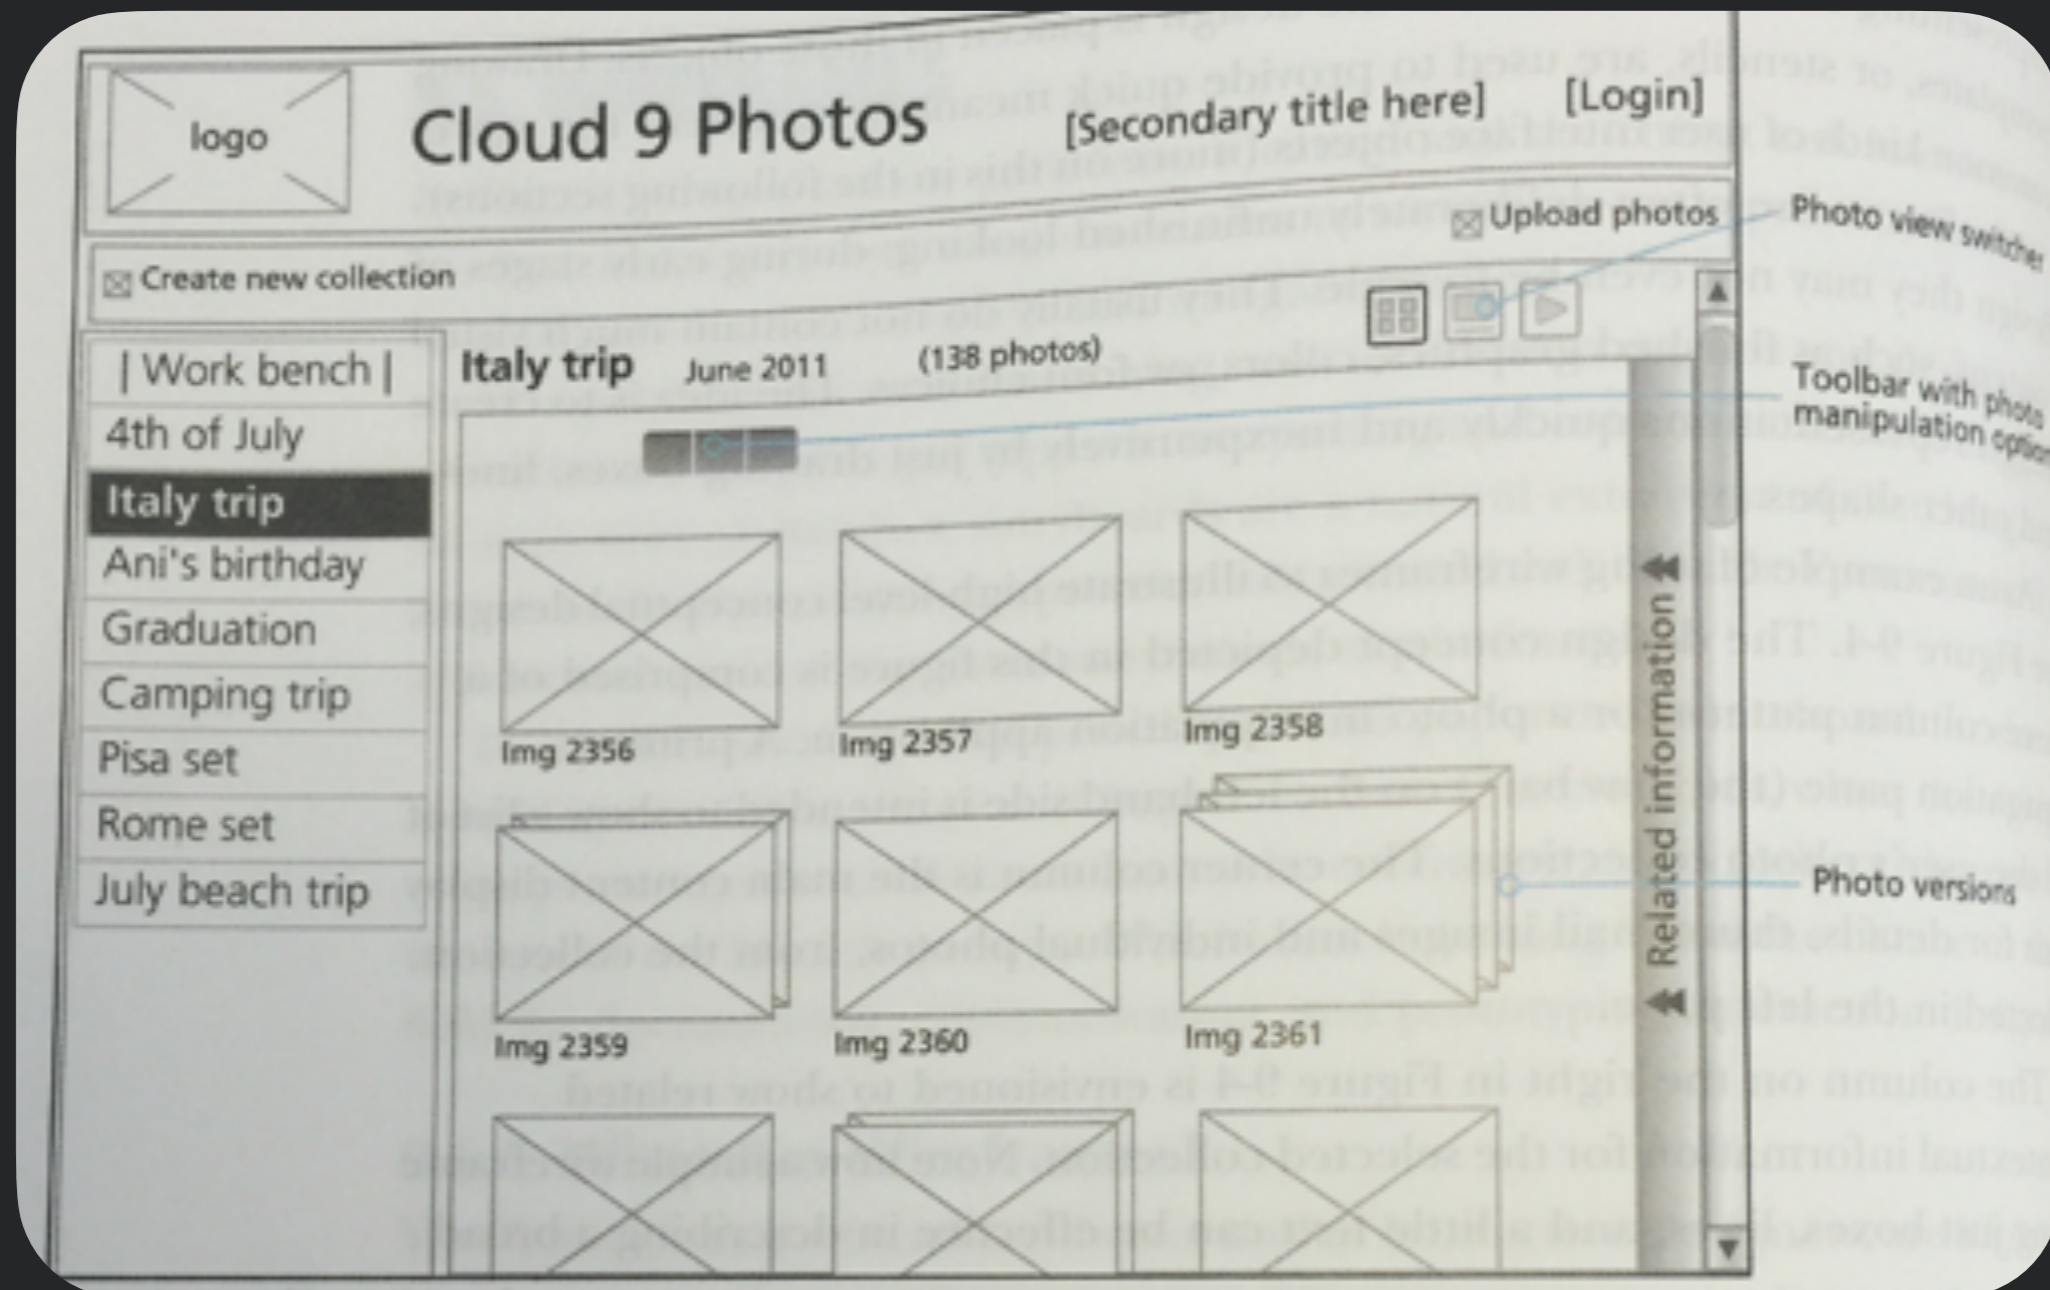

Wireframes

- Lines & outlines (“wireframes”) of boxes & other shapes
- Capturing emerging interaction designs
- Schematic designs to define screen content & visual flow
- Illustrate approximate visual layout, behavior, transitions emerging from task flows
- Deliberate unfinished: do not contain finished graphics, colors, or fonts

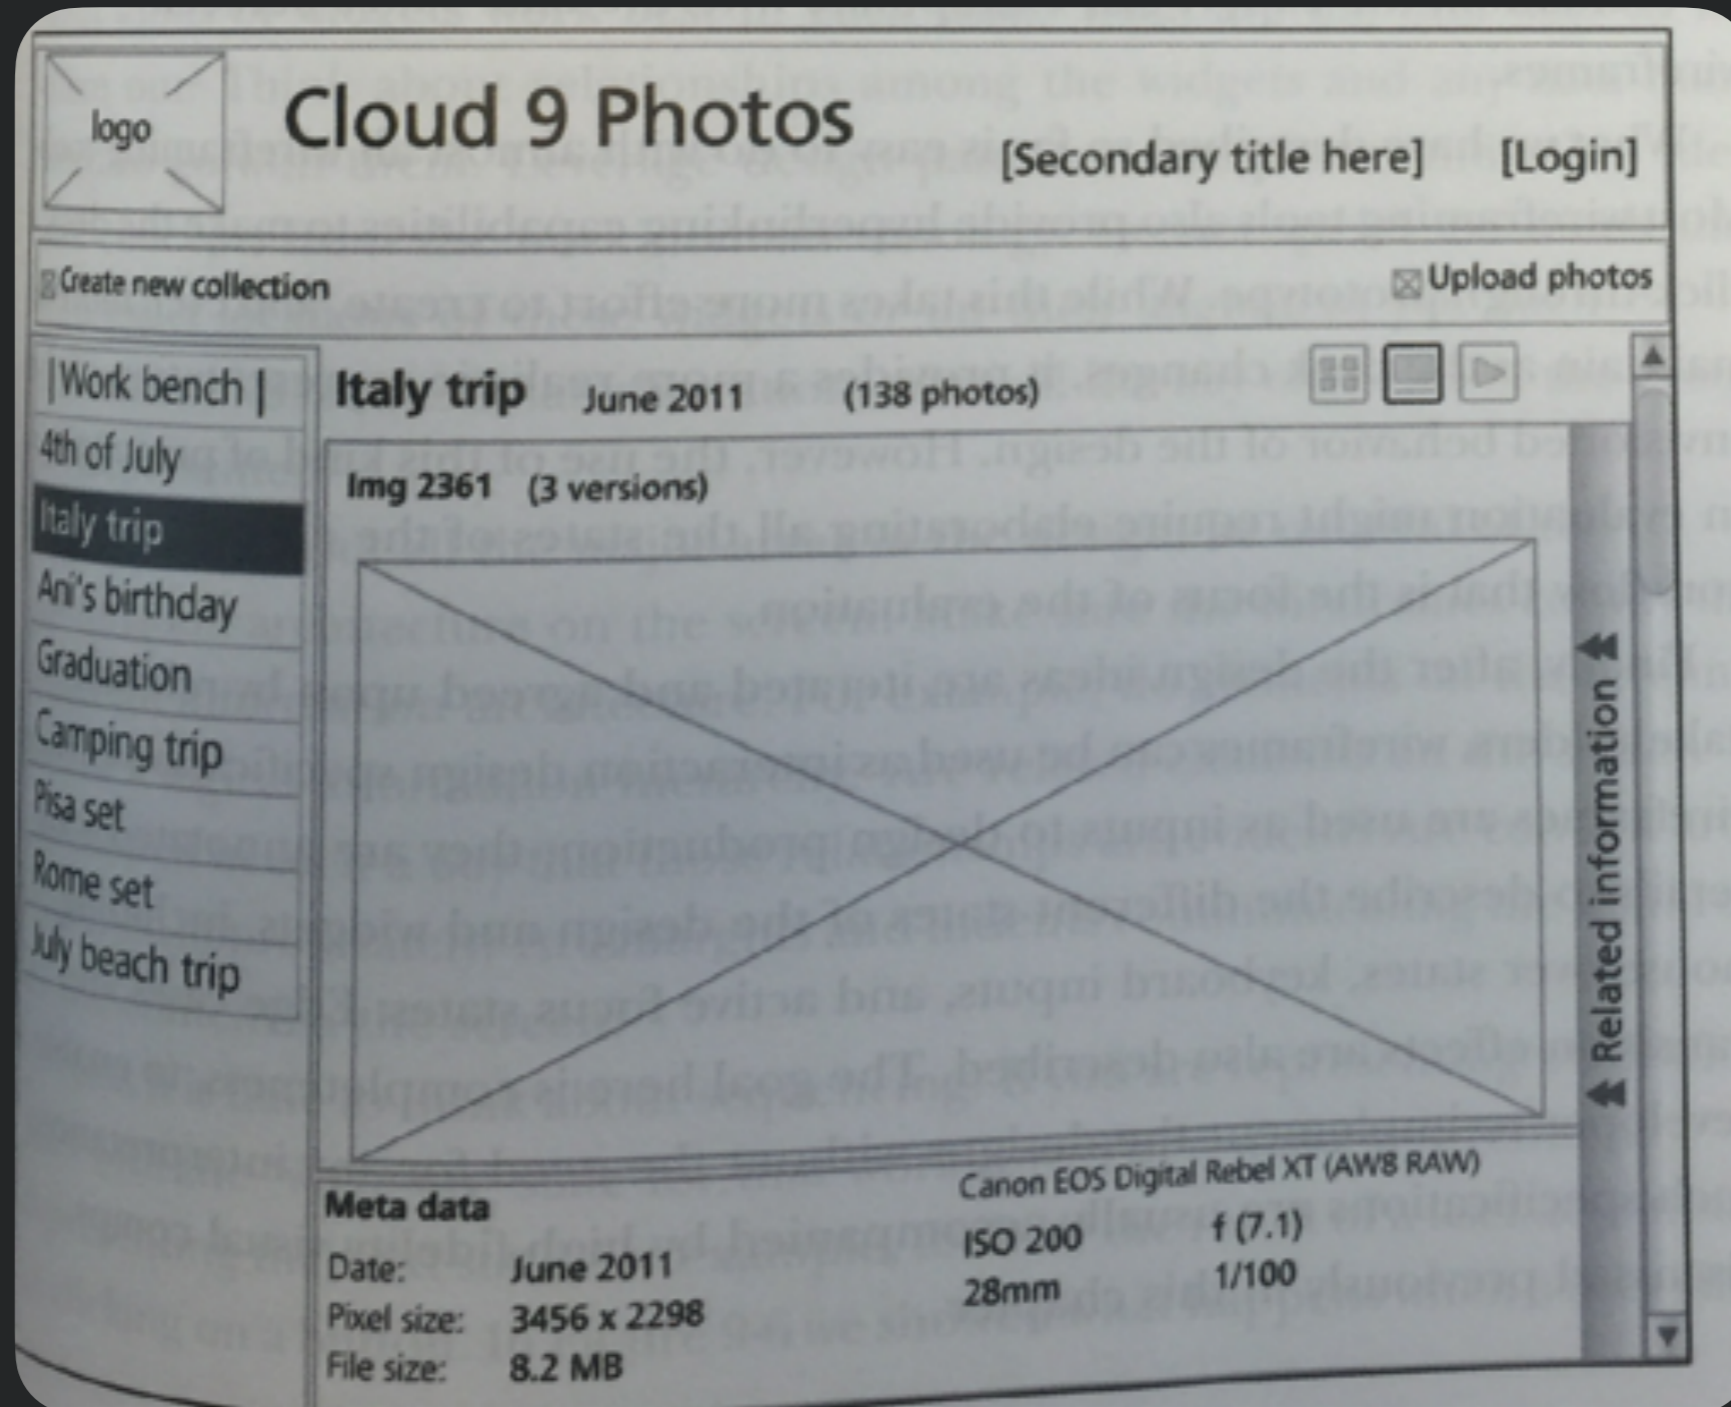

Example

Example

Example

Wireframes

- Can be used to step through a particular scenario
- Focus on key screens rather than every screen
- Tools can help
 - Can be made clickable
 - Can use stencils & templates; copy & edit similar screens

Creating a Wireframe - (I)

- What are the key interactions needed to support design?
- What widgets support these interactions?
- What are the best ways to lay them out?
- How do these relate to conceptual design & user's mental model?

Creating a Wireframe - (2)

- What are all of the items: toolbars, scrollbars, windows, ...?
- Are there too many widgets on the screen?
- What happens when data is larger than available space? Will entire page scroll, or individual panel?
- How much detail of items to show?

Example Tool - Balsamiq

Example Tool - Balsamiq

Design Critiques

- Stylized meeting for getting feedback on design sketches & prototypes
- Solicit feedback from peers
- History: studio art education

Designer: Frame the Discussion

- State *explicitly*: What would you like comments on?
 - Overall idea?
 - Usability?
 - Specific interaction design?
 - Visual design?
- Take a **dispassionate** stance (this is hard!)
 - Show alternatives where possible

Critic: How to Avoid Deaf Ears

- Comments about the *design*, not the designer
- Point out positive aspects - be *specific*
 - Not: “I like this, but...”
 - “The layout effectively communicate the hierarchical nature of the data. However...”
- Ask for *alternatives* instead of offering solutions
 - Not: “You should really change X”
 - Instead “Have you considered alternatives for X?”

Prototyping

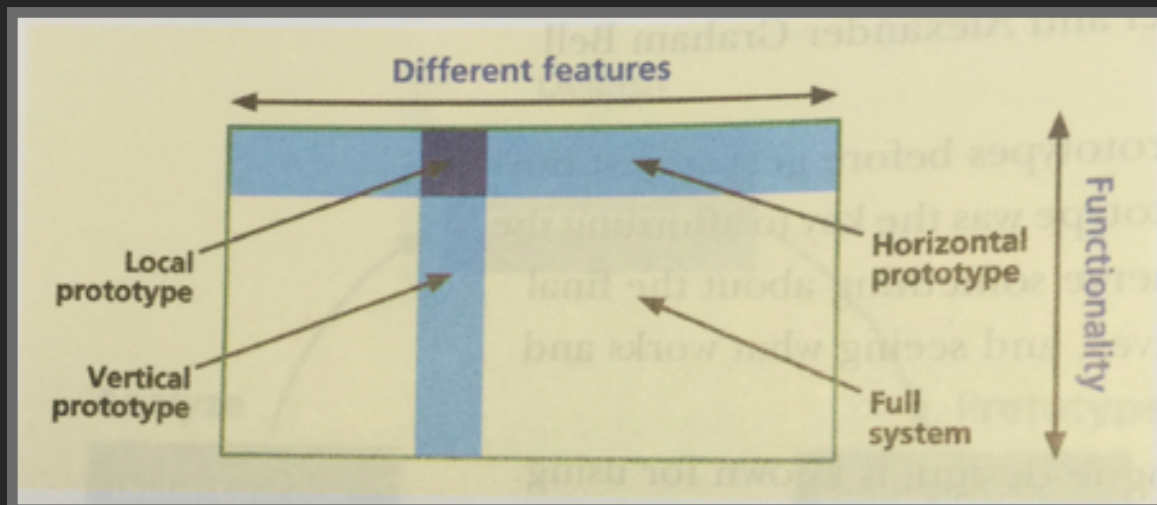

Prototyping

- How do you know your system design is right before you invest the time to build it?
- Answer: prototyping!
 - Evaluation performed **before** investing resources in building finished product
 - Early version of system constructed much **faster** & with less expense used to evaluate & **refine** design ideas

Types of Prototypes

- Which details do you leave out?
- **Horizontal**: *broad* in features, less depth
 - Explore overall concept of app, but not specific workflows
- **Vertical**: lots of *depth*, but only for a few features
 - Enables testing limited range of features w/ realistic user evals
- **T**: most of UI realized at low depth, few parts realized in depth
 - Combination of vertical & horizontal
- **Local**: focused prototype on *specific* interaction detail

Interactivity of Prototypes

- Scripted, click through prototypes
 - Prototype w/ **clickable** links to move between screens
 - Live action storyboard of screens
 - Simulates real **task flow**, but w/ static content
- Fully-implemented prototypes
 - Usually **expensive** to implement actual system
 - But can build key piece of system first to evaluate

Wizard of Oz

- Goal: *simulate* actual system w/ out building it
 - Want user to interact *as if* they were interacting w/ real system
 - Helps explore how users would interact w/ novel interaction if it were to exist
- Example: natural command line (Good et al 1984)
 - Users typed in commands to interact w/ computer
 - Commands intercepted by hidden human who interpreted commands & executed them

Paper Prototypes

- *Low fidelity* prototype w/ paper mockups
- **Goal:** get feedback from users early w/ very low cost interactive prototype of envisioned interaction design

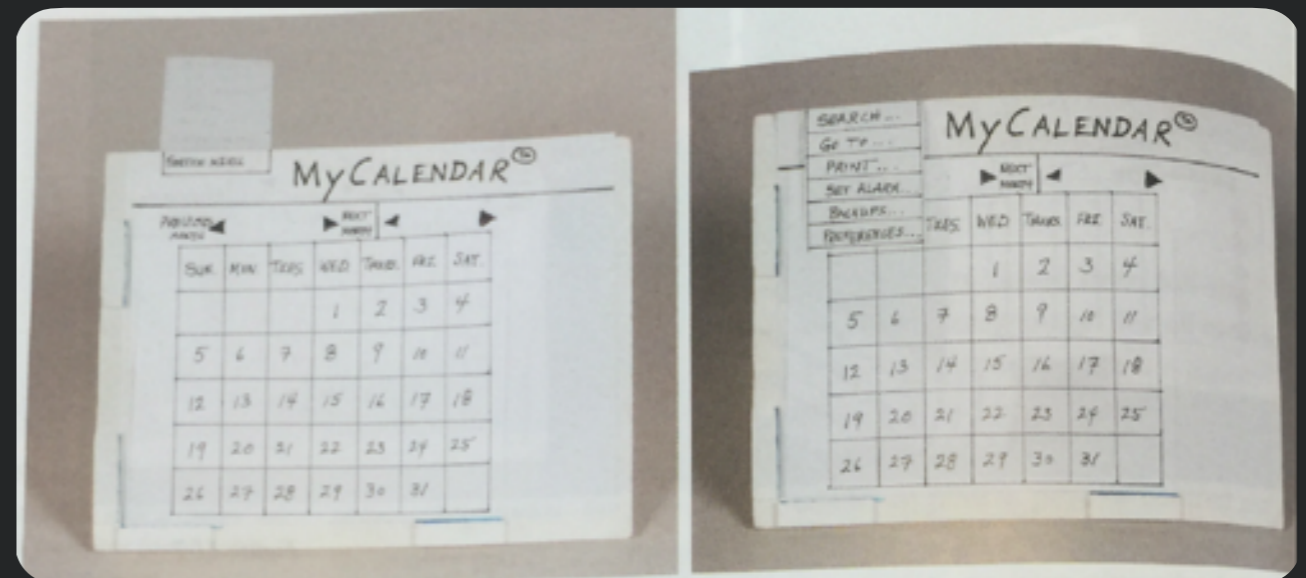

Paper Prototyping (I)

- Set a realistic deadline
- Gather set of paper prototyping materials
- Work ***fast*** & do not color within the lines
- Reuse existing sketches & mockups
- Make underlying paper mockups of key screens

Paper Prototyping (2)

- Use ***paper cutouts*** & tape onto full-size transparencies as “interaction sheets” for moving parts, making modular by including only a small amount
- Do not write or mark on interaction sheets
- Be ***creative***
- ***Reuse*** at every level
- Cut corners wherever possible (trade accuracy against efficiency)
- Make a “this feature not implemented” message

Paper Prototyping (3)

- Include “**decoy**” user interface objects not needed for expected tasks
- Accommodate data value entry by users w/ blank transparencies
- **Organize** materials to manage complex task threads
- **Pilot** test thoroughly

In Class Activity

Group activity

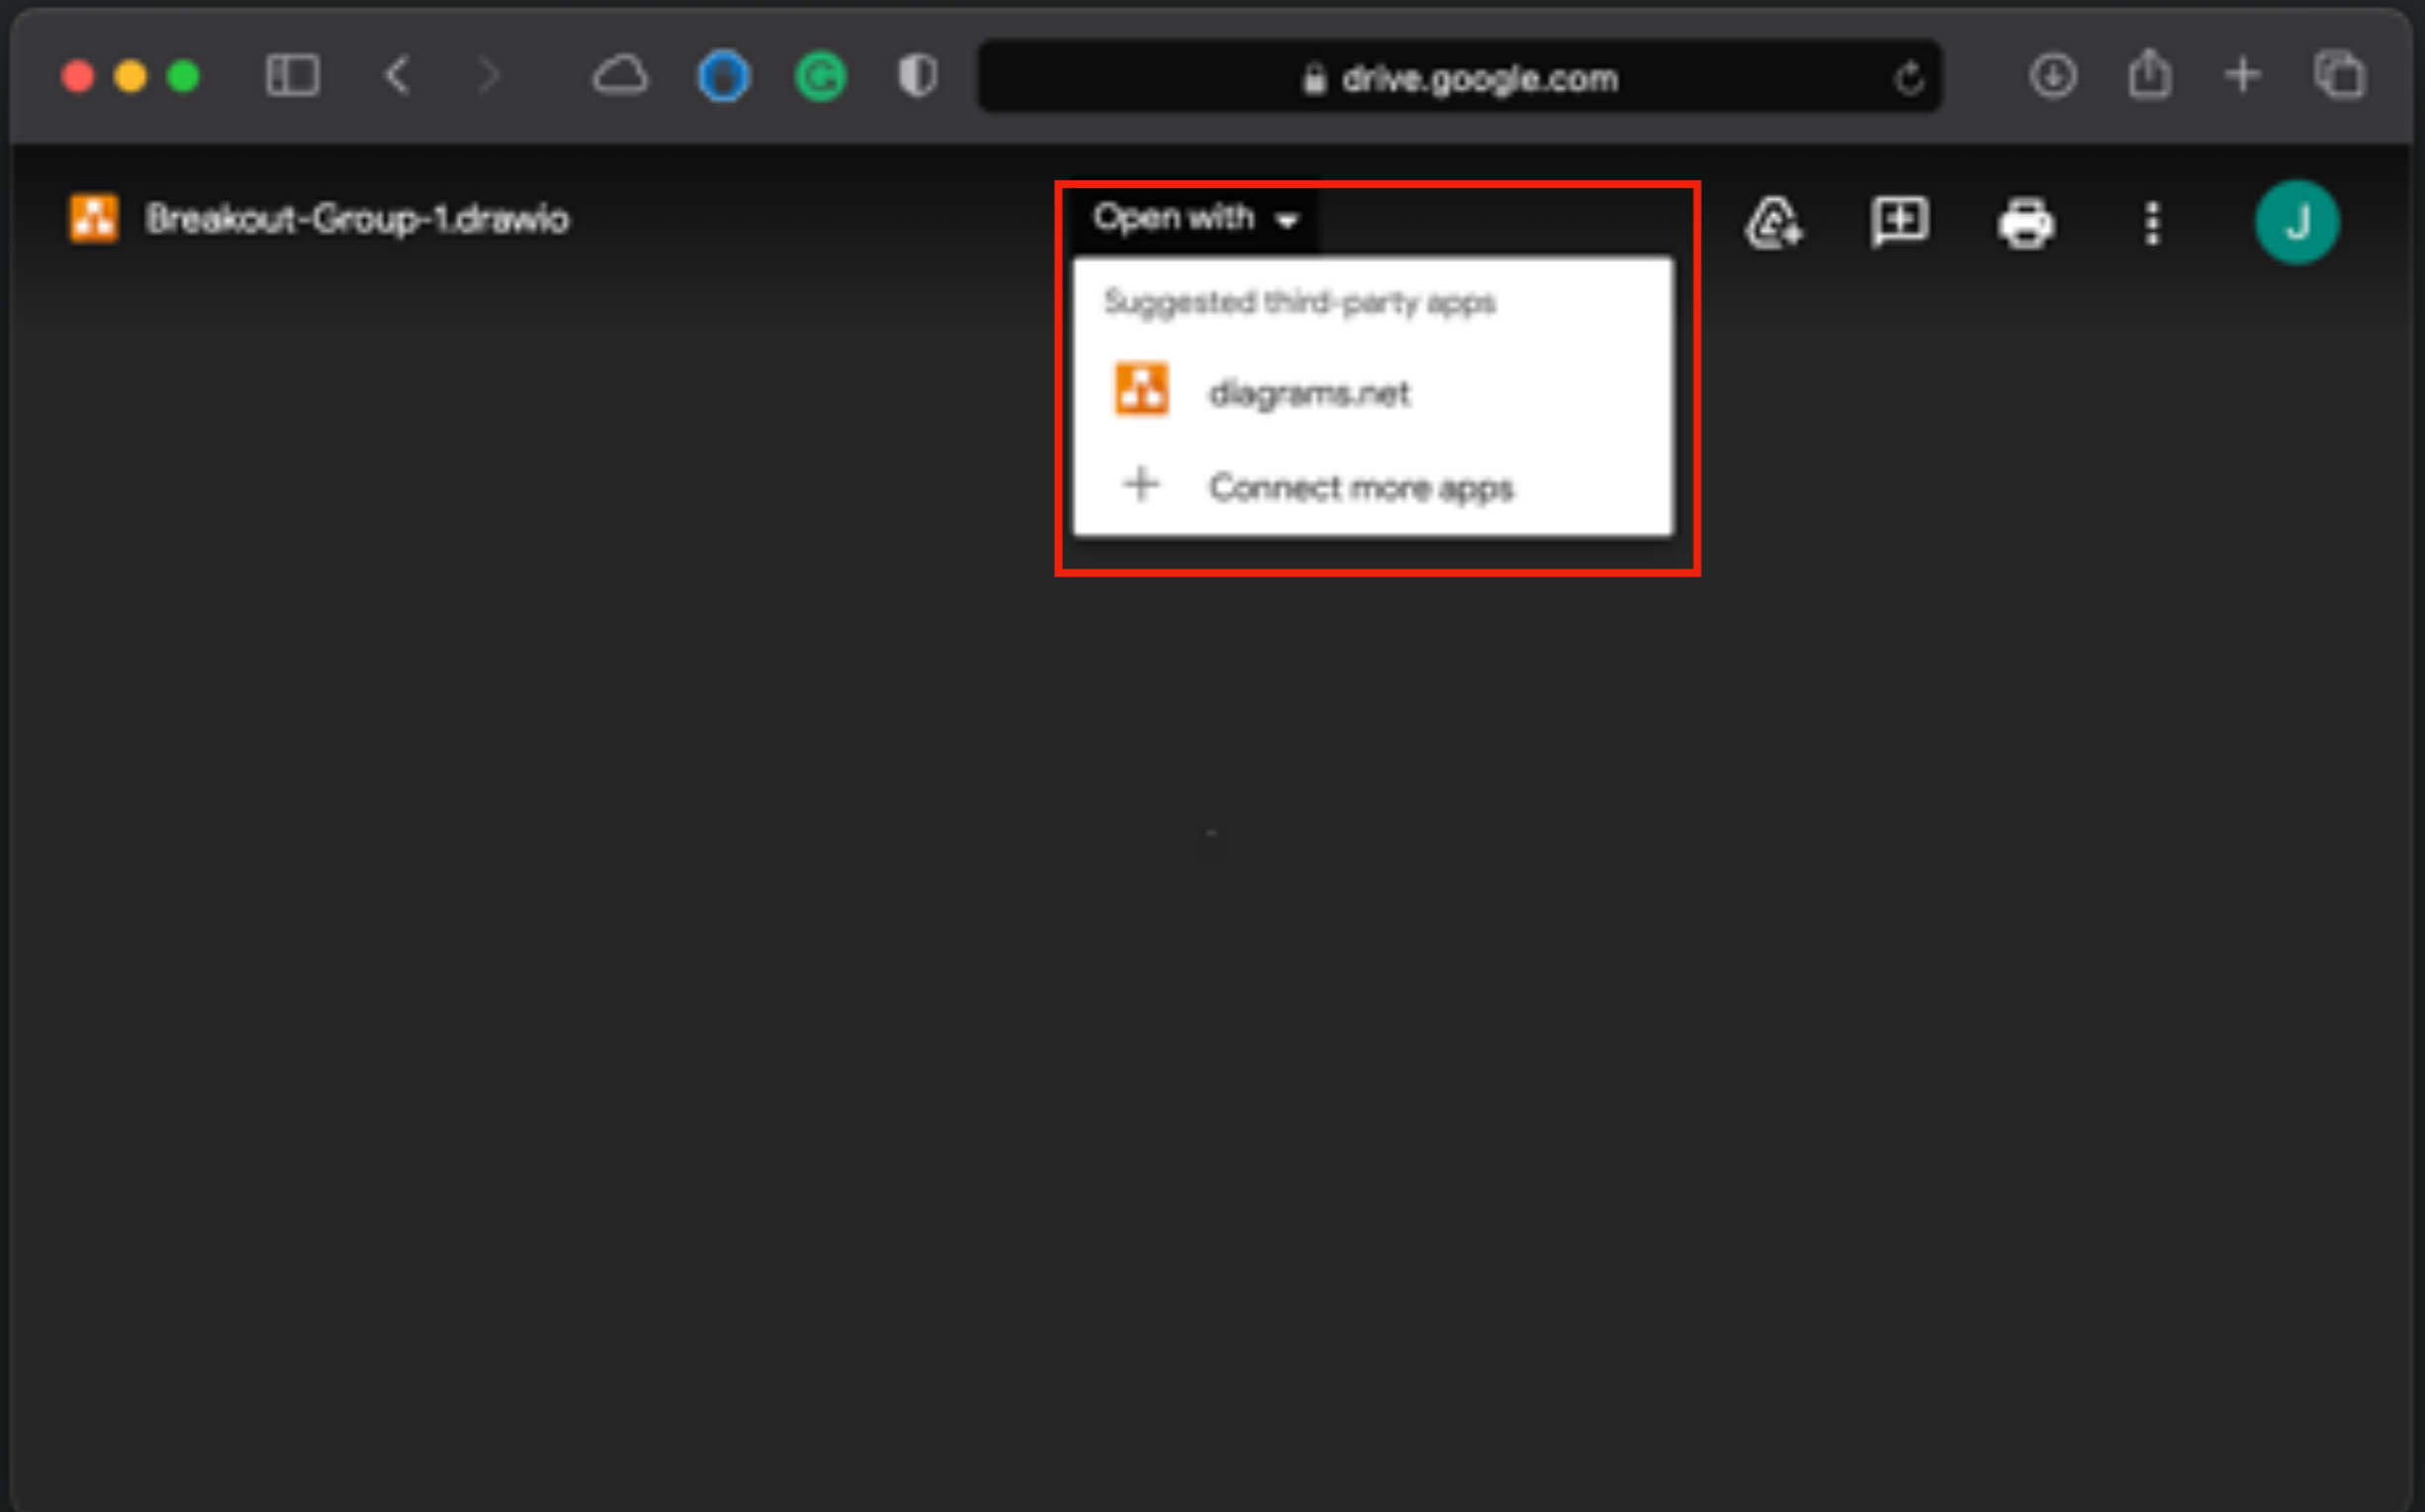

- In groups of 2:
 - Think of a web app that provides suggestions for COVID-safe activities
 - Start with a specific set of user needs identified
 - Create Wireframe design of a new system that addresses the users' needs
 - Build a series of at least wireframe “pages” supporting one scenario for the app.
 - 25-30 minutes

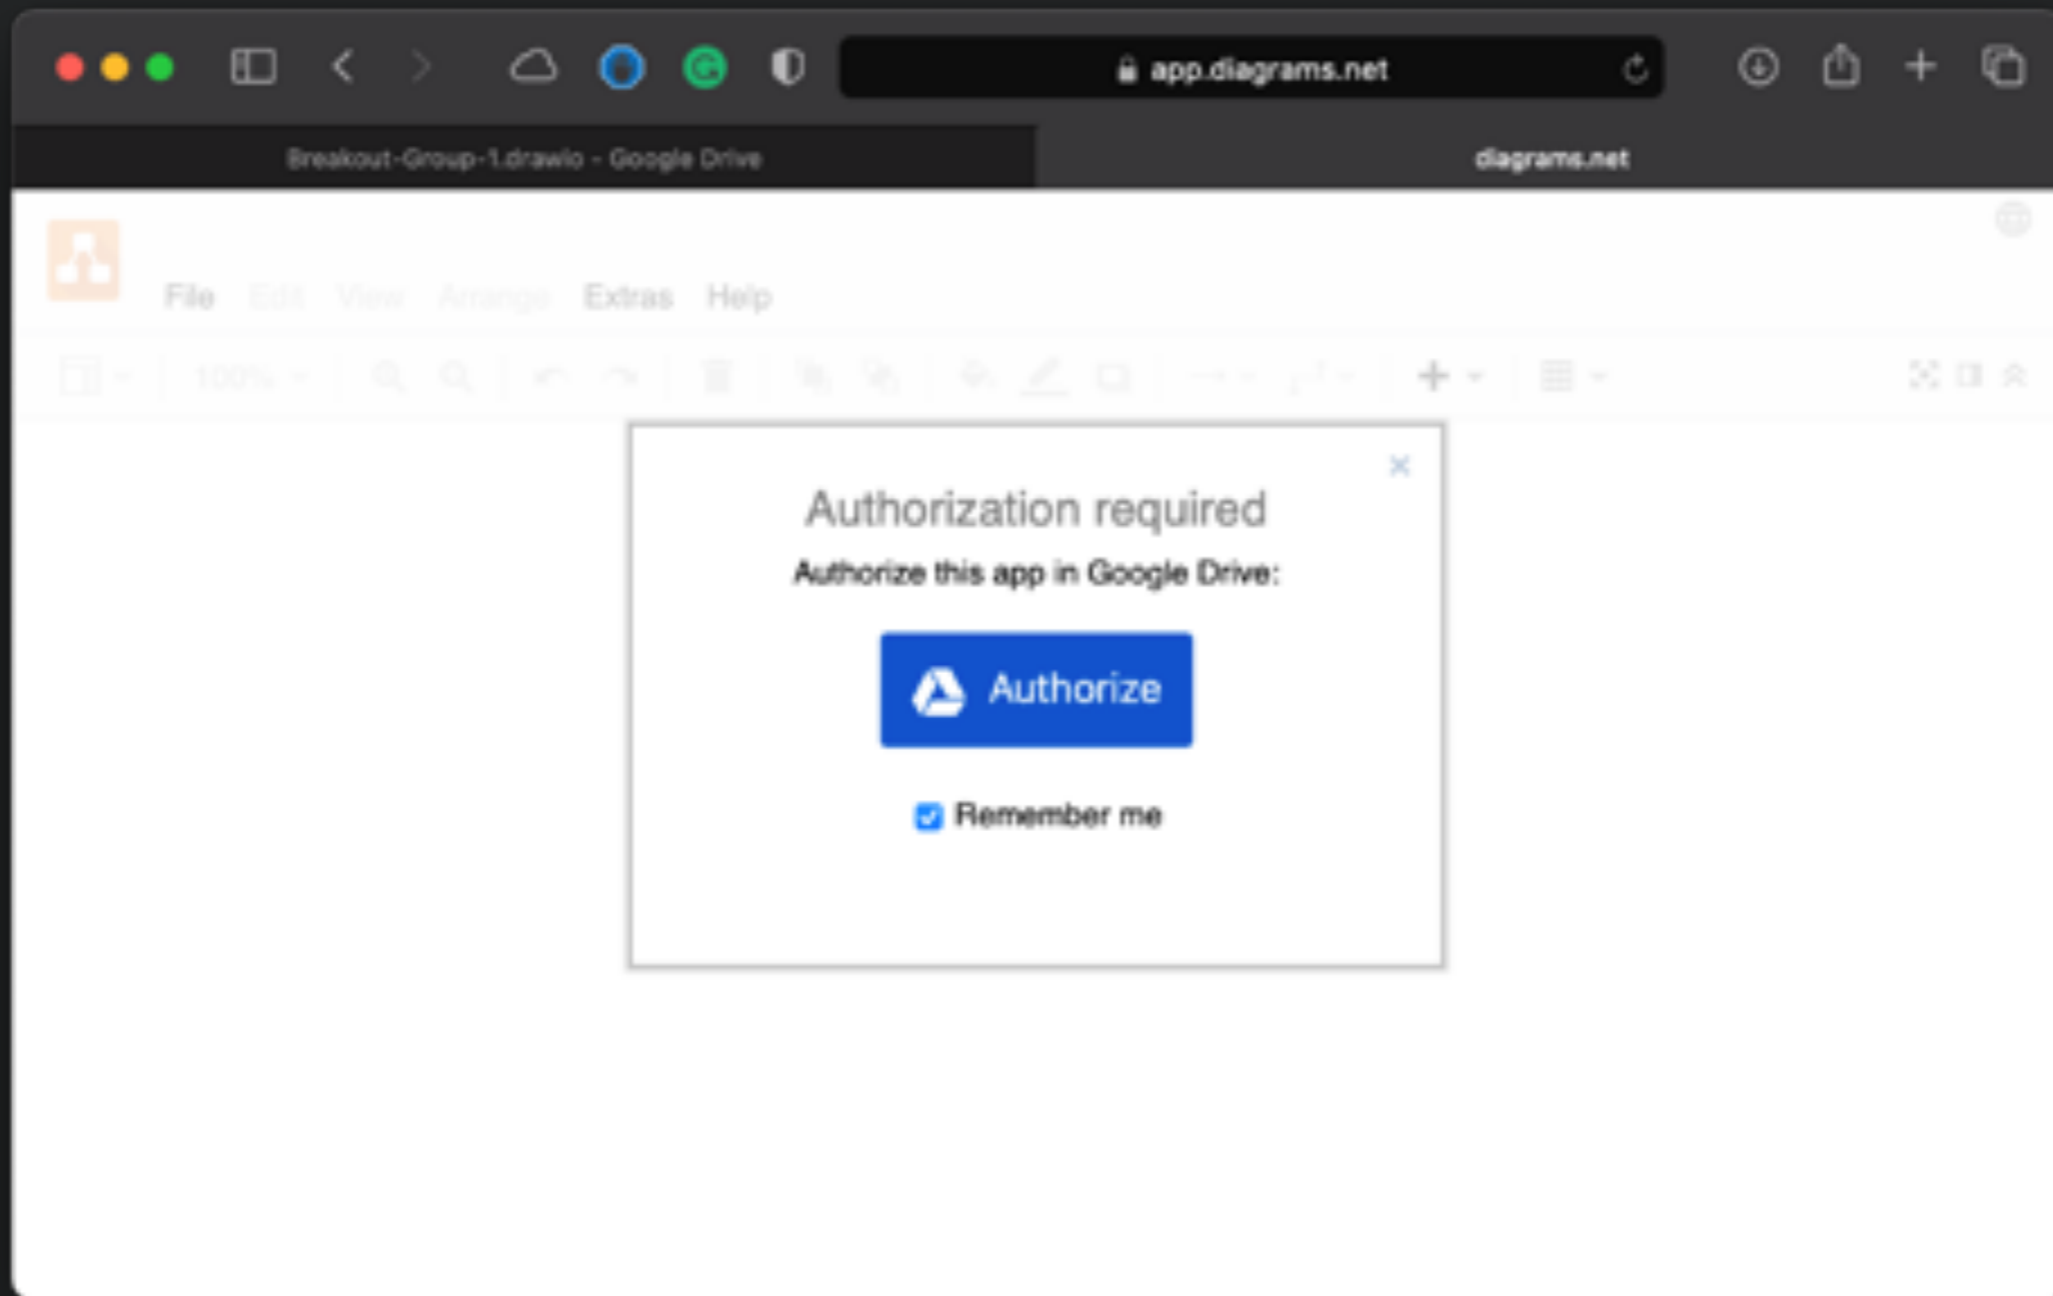

Using draw.io in G-Drive

Using draw.io in G-Drive

7 Minute Break

Notes for Next Semester

- 30-35 mins for virtual activity
- Rethink some of the slide ordering again
